

Abstract

[0029]

A lamp module and a back light device having the lamp module are provided. The lamp module includes a resilient holder, a lamp tube, and a support unit. The resilient holder has an accommodation portion, such as a cavity, for accommodating one end of the lamp tube. The support unit has a reception portion, such as a groove, for engaging with a plug portion of the resilient holder. The support unit has a ditch in one side and the lamp module further includes a conductive element disposed in the ditch for dissipating heat generated by the lamp tube.
